

## Exercise 1

a)

- **Initial phase** - characterize fully the data needs of the prospective database users.
- Second phase - choosing a data model.
  - Applying the concepts of the chosen data model.
  - Translating these requirements into a conceptual schema of the database.
  - A fully developed conceptual schema indicates the functional requirements of the enterprise.
- Final Phase - Moving from an abstract data model to the implementation

of the database

- Logical Design – Deciding on the database schema.
  - Database design requires that we find a “good” collection of relation schemas.
  - Business decision – What attributes should we record in the database?
  - Computer Science decision – What relation schemas should we have and how should the attributes be distributed among the various relation schemas?
- Physical Design – Deciding on the physical layout of the database.

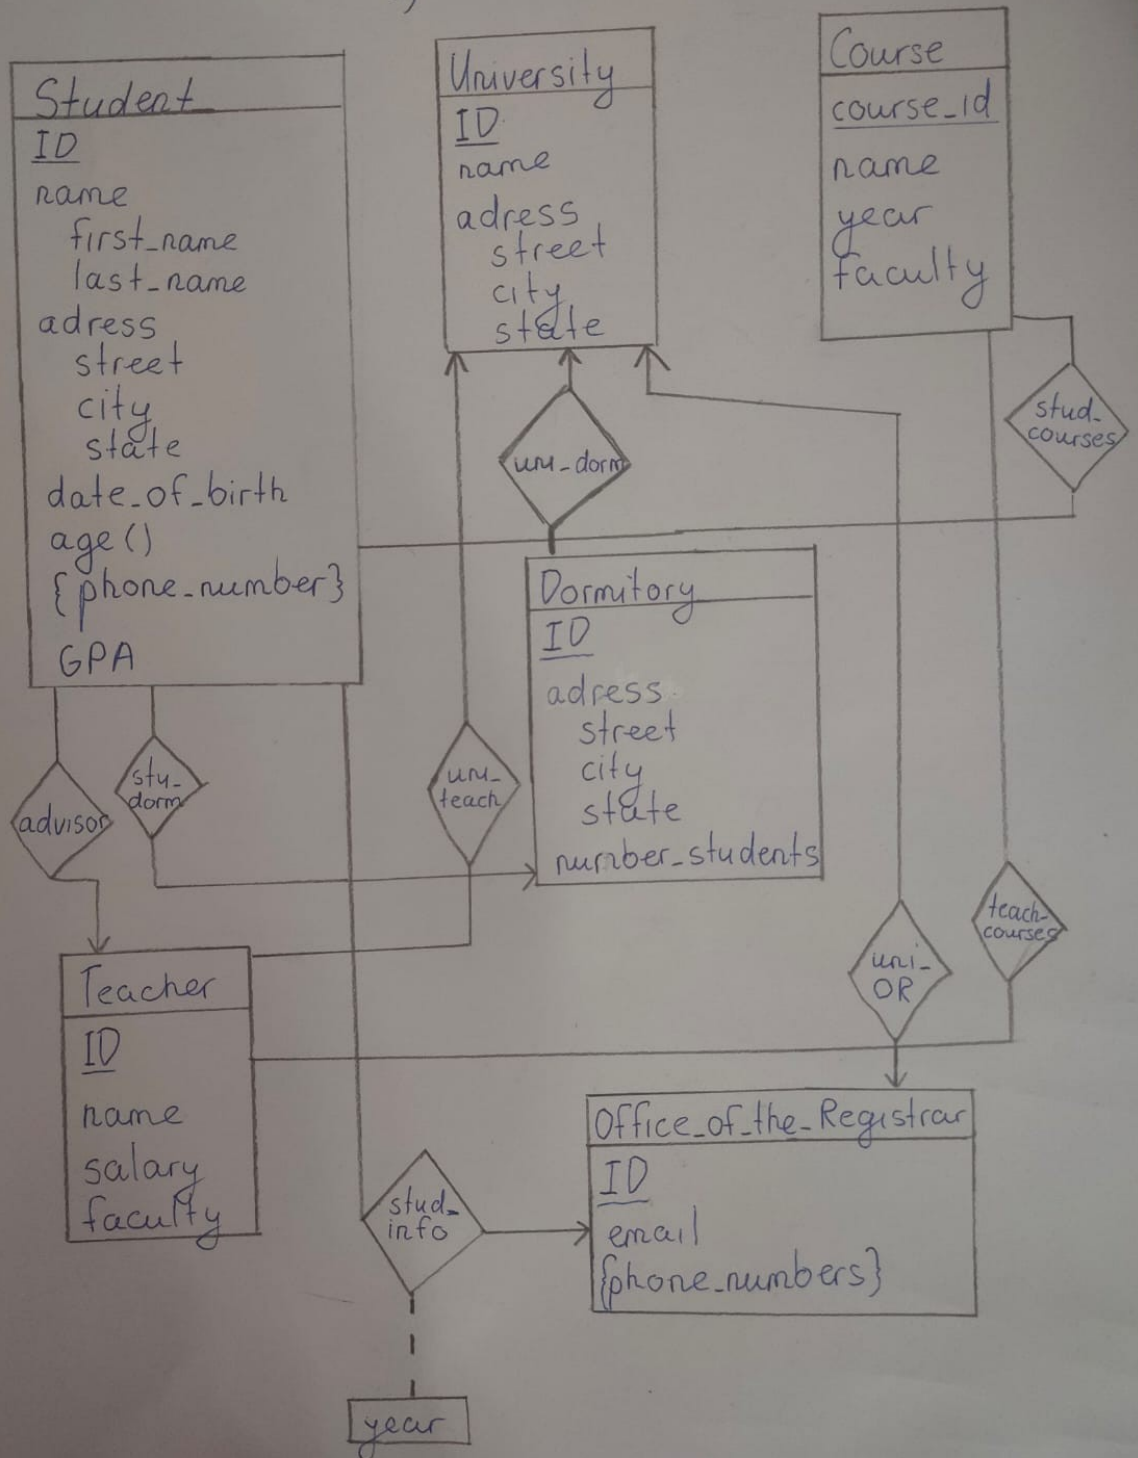

b)

An entity–relationship model (or ER model) describes interrelated things of interest in a specific domain of knowledge. A basic ER model is composed of entity types (which classify the things of interest) and specifies relationships that can exist between entities (instances of those entity types).

# Exercise 2, Exercise 4

a)

b)

### Exercise 3
